

Borehole Costing Model v2.8: Quick Start Guide

Overview

Once set up the model can quickly calculate the actual cost of a borehole (not the price). The first time the model is used it requires the unit costs to be entered for different materials and rigs. The model was built by Tom Heath, Richard Carter and Kerstin Danert. The model consists of three components: Model Unit Costs, Borehole Specifications and Results.

General

- The model is built in Microsoft Excel 2003
- **All costs need to be in USD.** Data can be entered in the local currency, but must be converted into USD – by clicking the convert buttons (converting the values based on the exchange rate set in Fixed Costs)
- Fill in data in the white cells (they will be yellow if empty)
- Dark Blue cells are formulas and should not be edited
- Light Blue cells are values in the local currency, based on the exchange rate set in Fixed Costs (these are for reference only and cannot be edited)
- Red Cells indicate the component costs of each section (e.g. Mobilisation is the total of labour, rig depreciation and vehicle costs)
- Each sheet is protected to avoid formulas being changed. The password to unlock a sheet is: **borehole**
- If there is an error, a warning will appear in bold black text with a yellow background
- The grey buttons at the top can be used to navigate the model
- A red triangle in the top right of a cell indicates there is a comment, hover over the triangle and the comment will pop up
- The model needs to have macros enabled (instruction on Home page)

Model Unit Costs (Model Setup)

1. Enter unit costs and labour costs in Fixed Costs
2. Enter the costs and diameters of casing and screen that are used when drilling in Casing Database
3. Enter the lifetime, use and costs of the rigs that are used in Drilling Database

Borehole Specifications (borehole details)

1. Fill in data on Home page
2. Check Fixed Costs are correct for borehole (in particular labour costs)
3. Fill in white cells and select rig and transport used in Mobilisation (select none if no vehicle used)
4. Fill in white cells in Drilling
5. Fill in white cells, select casing, screen and backfill in Casing
6. Fill in white cells in Development and Test Pumping

Results

1. Results displays a breakdown of the costs in a pie chart, a bill of quantities, cost break down (equipment, labour, consumables, fuel and vehicles) and a gantt chart for the borehole
2. Overheads provides brief info on the cost of overheads and allows for contract expenses
